

Overview

This package contains stylized low-poly 3D food assets and their corresponding workstations. Each asset is optimized for performance using a single material and texture, with UVs packed into gradient texture space for efficient memory usage.

All assets are preconfigured with prefabs and animations, ready for immediate use.

Demo Scenes

Two demo scenes are included:

1. **Food & Stations Showcase** – displays all food items and workstation models
2. **Workstation Animation Demo** – demonstrates animation states for work stations

In demo scenes you can:

- Toggle rotation animations on/off using UI buttons
 - Preview all assets without additional setup
-

Folder Structure

Art

- 3D models (food items and workstations)
- Textures and materials (shared gradient-based)
- Animations (for workstations)

Demo

- Demo scenes
- Prefabs for showcase without animator
- Demo scripts for interaction (UI, rotation toggles)

Prefabs

- Individual prefabs for each food item
- Main **Station prefab** used as a base for all workstations

Workstation Setup

Each workstation is structured using a parent prefab:

- **Child 3D Model (Workstation Mesh)**
 - Attached under the Station game object
 - Any transformation (position, rotation, scale) must be applied here not on the Station game object due to use in animation

Important rule:

- Do **not** modify transform on the Station root if animations are used
 - Always adjust the child 3D model instead
-

Animations

Each workstation includes three animation states:

- **Idle** – default loop state
- **Spawn** – entry animation
- **Working** – active/production animation

Animations are preconfigured and ready to use directly from the Station prefab.

Materials and Optimization

- All models use a **single shared material and texture**
 - UVs are packed into **gradient texture space** for optimization
 - This reduces draw calls and improves performance
-

Usage

- Drag food item prefabs directly into the scene
- Use the Station prefab and assign a workstation model as a child
- Play animations via Animator or trigger them through scripts

Notes

- Assets are designed for performance and scalability
- No additional setup is required for demo scenes
